What Makes Shopden Special

Summary of Shopden's features and why I created them.

Mikael La Ferla

Shopden is a revolutionary list-sharing mobile application with GPS/time-based notifications. Users can create customized shopping lists for any event while accessing real-time store prices and inventory. Users also can track their expenses by setting budgets for each list and comparing their current spending to previous purchases.

As a result, by combining list management, accurate prices and inventory, and store navigation all in one mobile application, Shopden will become the go-to shopping

application for consumers.

My vision for Shopden is to assist users by saving them time on shopping trips, organizing their shopping lists, and managing their spending budgets. These three principles seem simple, but it isn't easy to follow when juggling daily tasks, commitments, and responsibilities.

Shopden was born from my personal experience of losing track of time when shopping and my expenses. Having a mobile application organize all of my shopping needs while alerting me of nearby stores that actually have what I need is the solution we all need.
